Amana RentalHub NG LTD

Handbook Change Review

Version 1.4 | 7 November 2026

The August manual has been compared with the current repository and the completed support/privacy release. This review separates implemented controls from management proposals and work that remains incomplete. The original disciplinary and performance framework remains for formal company adoption.

Scope of this review

Sources include role definitions, route guards, services, web/native screens, migration files and focused test results. This is an implementation comparison, not a new legal opinion, a full penetration test or proof of physical biometric accuracy.

The original is preserved. The updated manual retains 14-point double-spaced prose and mixed portrait/landscape sections. Tables use compact readable text, repeated headings and corrected wrapping; the old static contents page numbers are replaced.

Current release and checks

Backend: 129 passed, 0 failed. Web: 156 passed, 0 failed. Web production build passed. Migration 2044 applied and real scoped search SQL checked. Android 1.0.60 build 71 built, signed and published. Its downloaded SHA256 is a00fcc30e4cfcb46c0c8a6c630c00913b3aa616cd488e9749571aceee7a55bbb. Same-version update checks return no update. iOS source is shared; no signed iOS binary was produced on Windows.

Source control record

Supplied handbook copy SHA256: 9f4c90726146090f13c2400ce73e7a75491b5de66b85eccfae392aa754f11392. Baseline backend HEAD: 4e8802042dd64dd4093c741b64ce419fca86de87. Mobile HEAD: 31241f04e48a981ab8fa653b7e1ce25e22fae046. Inspected working changes and migrations through 2044 are included; the hashes alone do not identify every working change.

1 Zonal roles

Earlier position: The role and reporting matrices described LGA, State and Super tiers only.

Updated position: Add the five implemented zonal roles. General zonal operations is distinct from zonal finance, legal, fumigation and transportation. There is no canonical zonal_support_admin or technical_admin in the current admin-role catalogue.

Implementation references: config/utils/roleHierarchy.js; config/utils/territorialZones.js; routes/zonalAdmin.js; routes/zonalFinancialAdmin.js

2 Assisted registration

Earlier position: The handbook did not describe the new support-assisted customer registration and receipt flow.

Updated position: Authorised support staff may create scoped tenant/landlord accounts with consent. Unpaid accounts remain behind payment gates. Actual cash collection creates a receipt and a remittance obligation; a different authorised supervisor acknowledges remittance. Staff do not receive the customer password or a customer session.

Implementation references: routes/assistedRegistration.js; services/assistedRegistrationService.js; services/assistedRegistrationPolicy.js; config/middleware/assistedAccessGate.js

3 Contact and sign in

Earlier position: Email-only assumptions omit assisted customers.

Updated position: Ordinary registration requires real email. Assisted accounts may omit it under the dedicated rules; phone verification remains required. Sign in can use verified phone or email. Card payment requires a real email; staff must never invent one. Google sign in is restricted to eligible existing tenant/landlord accounts and does not skip registration or account gates.

Implementation references: services/googleCustomerSignin.js; services/assistedRegistrationService.js; services/authService.js

4 Face photo and identity

Earlier position: The manual did not separate a face photo from passport-document verification or the current local engine.

Updated position: The live face photo supplies the protected profile avatar. The passport document is not an avatar. Official NIN/passport checks remain with Prembly; local face comparisons use the VPS worker. Missing, uncertain or conflicting checks require review.

Implementation references: services/identityPhotoService.js; services/localFaceService.js; routes/users.js

5 Liveness limits

Earlier position: Earlier implementation notes described paid provider face operations; the current code uses local comparison.

Updated position: Do not describe local liveness as proven against photographs, screens or recorded video. Automatic acceptance remains gated pending real validation. Consent, trusted portraits, duplicate-identity controls and human review remain necessary.

Implementation references: tools/local-face/worker.py; services/identityPhotoService.js; services/localFaceService.js

6 Office fingerprints

Earlier position: The handbook did not cover SourceAFIS office verification.

Updated position: U.are.U 4500 capture is an office Windows website flow. SourceAFIS verifies one chosen account using consent and fresh phone approval. It does not search all accounts, provide liveness, sign a customer in, reset a password or complete KYC.

Implementation references: services/officeFingerprintService.js; services/fingerprintMatcher.js

7 Property updates

Earlier position: Ordinary moderation text omitted approval of existing listing amendments.

Updated position: Description, amenities and structured-feature edits become pending requests. Public values stay unchanged until a permitted independent reviewer approves the stored proposal. Rejection, withdrawal, stale baselines and territory restrictions have separate controls.

Implementation references: services/propertyUpdateService.js; routes/properties.js; routes/admin.js

8 Volunteer recruitment

Earlier position: Employment-focused recruitment wording could imply payment or automatic onboarding for volunteers.

Updated position: Use the existing Careers module. Volunteer applications have an independent persisted toggle controlled by Super Admin. Database role type controls the free path; volunteers skip Paystack and do not create staff accounts, salary rights or compulsory proctored interviews.

Implementation references: services/recruitmentService.js; routes/recruitment.js; client/src/pages/Careers.jsx

9 Private support and contacts

Earlier position: The manual did not define the current contact collection and account lookup safeguards.

Updated position: Signed-in queries use the saved account contacts. New guest forms collect phone and email. An unambiguous two-contact guest match is only a possible match; it does not prove ownership. Staff lookup is scoped, MFA protected, rate limited, audited and read only.

Implementation references: services/supportCustomerService.js; routes/support.js; client/src/components/admin/SupportCustomerCard.jsx

10 Support to dispute

Earlier position: Escalate to legal did not explain whether the opposite party hears a private complaint.

Updated position: A private ticket does not notify the other tenant or landlord. A scoped Support Admin prepares an approved summary and the exact customer consents before a formal case is created or linked. Private replies, contact forms, attachments and staff notes are not copied.

Implementation references: services/supportDisputeHandoverService.js; routes/supportDisputes.js; migrations/2043_support_dispute_handovers.sql

11 Case responsibility and closure

Earlier position: The earlier manual did not separate the case officer, mediator, lawyer and external outcome.

Updated position: A named Support Admin follows up the case. An authorised lawyer handles legal work when required; this is not automatic neutral mediation. Both participants receive formal case alerts. The new handover does not add a both-party settlement-acceptance gate or automatic external filing.

Implementation references: services/disputeNotificationService.js; services/disputeService.js; config/middleware/disputeAccessMiddleware.js

12 Public cases and directory

Earlier position: Public and internal service wording was not clearly separated.

Updated position: The public cases page shows anonymised approved resolved-case material. Lawyer directories and assistance records remain internal. Staff must review narratives and attachments for indirect identification before publication; masking labels alone is insufficient.

Implementation references: routes/legal.js; services/legalService.js; client/src/pages/Cases.jsx

13 Property contacts and unlock

Earlier position: The older handbook did not specify that paid unlock no longer gives landlord contacts to customers.

Updated position: Public and customer property responses omit phone/email, including paid unlock and participant lists. Protected authorised staff routes retain necessary access. Text filters cannot guarantee that all contacts are absent from photographs, audio, video or new obfuscations.

Implementation references: config/utils/propertyContactPrivacy.js; services/propertyService.js; routes/properties.js

14 Inbox and negotiation

Earlier position: The manual did not distinguish the inbox from the property application conversation.

Updated position: The main inbox supports customer-to-admin conversations. Property negotiation has its own application conversation. Shared server controls block detected contact sharing in the relevant flows, and repeated attempts are recorded persistently. Use consented private support forms when contacts are genuinely needed.

Implementation references: services/contactPolicyService.js; config/utils/contactPolicy.js; routes/messages.js; services/supportContactService.js

15 Widgets and AI

Earlier position: Old notes could be read as giving a chatbot unrestricted account access.

Updated position: The on-site and WhatsApp-style widgets use owner-scoped account facts and reviewed ticket handoff. Generative help depends on its configured provider and can fall back to guided help. It cannot change accounts or promise to answer every question. Meta WhatsApp is a separate integration.

Implementation references: services/accountAssistantService.js; services/supportAssistantService.js; routes/support.js

16 WhatsApp property updates

Earlier position: An older audit described text-only sending and receipt acknowledgement without reconciliation.

Updated position: The newer property-alert flow records opt in, approved-template delivery jobs, retries and webhook receipt/STOP processing. Meta credentials and an approved active template are still deployment requirements; delivery is not guaranteed merely by storing a job.

Implementation references: config/utils/propertyAlertService.js; services/propertyAlertDeliveryService.js; routes/whatsappWebhook.js; migrations/2029_property_request_delivery_policy.sql

17 Security and languages

Earlier position: The manual did not describe the current privileged MFA and customer/admin language boundary.

Updated position: Use privileged MFA where required. Never solicit OTPs, passwords or payment PINs in chat. Customer screens support the configured languages, including Arabic direction changes; administrator screens remain English. A tour or translated label cannot grant permission.

Implementation references: config/utils/twoFactor.js; config/utils/roleHierarchy.js; RentalHubMobile/src/i18n; RentalHubMobile/src/navigation

18 Release and alerts

Earlier position: Old release notes and static contents page numbers were out of date.

Updated position: Android v1.0.60 build 71 is published; same-version checks do not request another update. Shared iOS source changes still require a signed iOS build. Bell records, push receipt and launcher dots/numbers are different stages, and device settings affect presentation. Replace obsolete static contents numbers.

Implementation references: RentalHubMobile/android/app/build.gradle; RentalHubMobile/src/context/NotificationContext.js; routes/downloads.js; routes/mobileDiagnostics.js

19 Conduct acknowledgement

Earlier position: An electronic signing and NGN 5000 submission idea was discussed but is not implemented.

Updated position: Prepare unsigned role-specific conduct forms for management adoption, excluding Super Admin only. Do not state that the dashboard, payment collection or electronic submission already exists. Physical delivery is free under the user direction; any future optional paid digital service requires an approved separately implemented flow.

Implementation references: config/utils/roleHierarchy.js; handbook approval and adoption provisions; repository conduct search

Items requiring review or further work

Fingerprint build source

This checkout contains the built matcher JAR but its Maven POM and build sources are missing. Restore controlled build sources and licences before a future rebuild. This alone does not prove that the deployed matcher is broken; check its health separately.

Biometric automation

Physical genuine-camera and photo, screen and replay-attack validation remains incomplete. Continue human review. Health checks and model tests do not establish spoof resistance.

Case mediation and closure

A named support officer and formal alerts exist. Automatic neutral-mediator appointment, a new both-party settlement acceptance gate and automatic external filing do not. Apply the documented human completion checklist and use existing authorised legal processes.

Contact filtering

Shared text guards and private forms exist, but image/audio/video contact extraction and all obfuscations are not covered. Continue scoped staff review; do not claim that off-platform circumvention is impossible.

Public case anonymity

Review full narratives and media as well as masked names. Do not publish recognisable third-party information merely because a case is resolved.

External delivery

Meta approval, consent and sender setup remain requirements. SMS/email/push queues and bell records are not guarantees of delivery, reading or consent.

Conduct submission

This pack supplies unsigned forms for adoption. It does not add a dashboard, signature provider, NGN 5000 checkout, recruitment inbox or employment appointment. Approve and implement any optional digital-submission service separately.

Role references

Use the current canonical role catalogue. Legacy route mentions of non-catalogue roles require code review before appointments or permission changes. Documentation is not permission to expand access.

Management adoption

The original disciplinary sanctions, appraisal targets and reporting proposals remain subject to formal adoption and applicable professional/contract review. No new automatic penalty or payroll deduction is created by this update.

Staff signing pack coverage

The pack contains 24 job-specific unsigned forms covering all 26 current administrator role IDs except super_admin. The two pairs of LGA service aliases share their respective forms. Departmental Super administrators are included. Marketing Agent is a separate non-admin role and is not silently treated as a privileged administrator.

Next company actions

Review the revised handbook, confirm actual reporting assignments, adopt approved policies and issue the correct role form. Retain signed copies securely and record receipt through an approved process. The PDF pack does not itself install a conduct dashboard or collect the proposed electronic-submission fee.
